# PROJECT ABSTRACT

The project "**Import Data Using Transform Maps (Spreadsheet) in ServiceNow"** focuses on importing and managing data efficiently in the ServiceNow platform. Data is commonly maintained in spreadsheets such as Excel files, and manually entering a large amount of data into ServiceNow can be time-consuming and may lead to errors.

This project demonstrates how spreadsheet data can be imported into ServiceNow using **Import Sets and Transform Maps**. The spreadsheet is first prepared with the required fields and records. The data is then loaded into ServiceNow through an Import Set. A Transform Map is created to define how the imported source fields should be transferred to the appropriate fields in the target table.

The project also demonstrates field mapping, data transformation, validation, duplicate handling, and verification of the imported records. The process helps reduce manual data entry and improves data consistency and accuracy.

The main objective of this project is to understand the complete data-import process in ServiceNow and gain practical knowledge of **Import Sets, Transform Maps, Source Tables, Target Tables, Field Mapping, Coalesce, and Data Validation.

# 1. INTRODUCTION

## 1.1 Purpose

The purpose of this project is to demonstrate how spreadsheet data can be imported into ServiceNow using Import Sets and Transform Maps.

The project helps to:
* Reduce manual data entry.
* Import multiple records at the same time.
* Map spreadsheet fields to ServiceNow fields.
* Transform data according to requirements.
* Identify and handle duplicate records.
* Validate imported information.
* Improve data accuracy and consistency.

## 1.2 Scope

The scope of this project includes the complete process of importing spreadsheet data into ServiceNow.

The project covers:
* Preparing spreadsheet data.
* Loading spreadsheet data into ServiceNow.
* Creating an Import Set.
* Creating a Transform Map.
* Mapping source fields to target fields.
* Using transformation rules.
* Validating imported records.
* Checking the transformation results.

The same concept can be applied to employee information, user data, asset information, incident information, and other organizational data.

## 1.3 Technologies Used

The following technologies and tools are used in this project:

- **ServiceNow Platform** – Main platform used for data import and transformation.
- **Microsoft Excel / Spreadsheet** – Used to prepare the source data.
- **Import Sets** – Used to temporarily store imported data.
- **Transform Maps** – Used to define the transformation and field mapping.
- **ServiceNow Tables** – Used to store the final transformed records.
- **Transform Scripts** – Used when additional data processing is required.

## 1.4 Objectives

The major objectives of the project are:

1. To understand the ServiceNow data import process.
2. To import spreadsheet data into ServiceNow.
3. To understand Import Sets.
4. To create and configure Transform Maps.
5. To map source fields with target fields.
6. To understand data transformation.
7. To identify duplicate records.
8. To validate imported records.
9. To reduce manual data entry.
10. To gain practical experience with ServiceNow administration.

## 1.5 Target Users

This project can be useful for:

* ServiceNow Administrators
* ServiceNow Developers
* IT Support Teams
* Database Administrators
* System Administrators
* Organizations migrating data
* Students learning ServiceNow

## 1.6 Benefits

The main benefits of using Transform Maps for spreadsheet data import are:

* Faster data entry.
* Reduced manual work.
* Better data consistency.
* Reduced human errors.
* Easy field mapping.
* Efficient handling of large datasets.
* Improved data management.
* Ability to update existing records.
* Easy validation of imported data.

# 2. SYSTEM REQUIREMENTS

## 2.1 Functional Requirements

The system should provide the following functions:

- Upload spreadsheet data.
- Read the source data.
- Create or use an Import Set.
- Store imported records temporarily.
- Create a Transform Map.
- Select source and target tables.
- Map source fields to target fields.
- Transform the imported data.
- Insert or update target records.
- Display transformation results.
- Validate the final records.
-

## 2.2 Non-Functional Requirements

The project should satisfy the following requirements:

- **Performance -**The system should be able to process multiple spreadsheet records efficiently.
- **Accuracy -**The imported information should match the source data after transformation.
- **Reliability -**The data import process should provide consistent results.
- **Usability -**The process should be easy for an administrator to understand and operate.
- **Security -**Only authorized users should be allowed to import or modify organizational data.
- **Maintainability -**The Transform Map and field mappings should be easy to modify when requirements change.

## 2.3 Hardware Requirements

The project does not require high-end hardware because ServiceNow is a cloud-based platform.

Basic requirements include:

- Computer or laptop
- Minimum 4 GB RAM
- Modern processor
- Keyboard and mouse
- Display monitor
- Stable internet connection

## 2.4 Software Requirements

The software requirements include:

- Windows / Linux / macOS
- Modern web browser
- ServiceNow instance
- Microsoft Excel or another spreadsheet application
- Internet connection

## 2.5 Network Requirements

A stable internet connection is required to access the ServiceNow instance.
The network should provide:

- Stable internet connectivity.
- Access to the ServiceNow instance.
- Secure communication.
- Sufficient bandwidth for uploading spreadsheet files.

## 2.6 Database Schema and Design

The project uses a simple data flow to import spreadsheet data into ServiceNow:
**Spreadsheet → Import Set Table → Transform Map → Target Table**
The spreadsheet contains the source data. The Import Set temporarily stores the imported data, while the Transform Map maps and transforms the fields before storing the final records in the target ServiceNow table.

## 2.7 ServiceNow Overview

Content: What ServiceNow is, its purpose, and how it is used in your project.

## 2.8 Data Import Process in ServiceNow

overall flow:
Excel → Import Set → Import Set Table → Transform Map → Target Table

## 2.9 Import Sets

Explain:

- What is an Import Set?
- Why it is used
- How spreadsheet data is temporarily stored
- Role in your project

## 2.10 Transform Maps

You already have this content. Place it here as a separate concept before the practical work.

## 2.11 Source Table and Target Table

- Explain the difference between:
- Source/Import Set table
- Target ServiceNow table
- Add a small comparison table.

## 2.12 Field Mapping

Explain how:

- Employee Name → Name
- Role → Role
- Experience → Experience
- Department → Department

## 2.13 Coalesce and Duplicate Handling

Explain how ServiceNow can identify an existing record and avoid unnecessary duplicate records when properly configured.

## 2.14 Data Validation

Explain checking:

- Missing values
- Incorrect values
- Duplicate records

# 3. IMPORT SET AND TRANSFORM MAP

## 3.1 Import Set Overview

An Import Set is used to bring external data into ServiceNow for processing.

When spreadsheet data is imported, it is first stored in an Import Set table. This allows the imported information to be processed before it is transferred to the final target table.

The basic process is:

Spreadsheet → Import Set → Transform Map → Target Table

Import Sets are useful because the original imported data can be reviewed before transformation.

## 3.2 Spreadsheet Data Preparation

Before importing the data, the spreadsheet must be prepared properly.

For example, an employee spreadsheet may contain:

| Employee ID | Name | Department | Email |
|---|---|---|---|
| E001 | Arun | CSE | arun1@gmail.com |
| E002 | Priya | HR | priya6@gmail.com |
| E003 | Rahul | IT | rahul@gmail.com |

The spreadsheet should have:

- Proper column headings.
- Correct data values.
- No unnecessary blank rows.
- Consistent data formats.
- Unique identifiers where required.

Proper preparation reduces errors during the import process.

## 3.3 Creating an Import Set

The spreadsheet is loaded into ServiceNow through the data import functionality.

During the process, ServiceNow reads the spreadsheet and creates an Import Set containing the imported records.

The Import Set acts as a temporary storage area between the spreadsheet and the final ServiceNow table.

## 3.4 Importing Spreadsheet Data

The spreadsheet file is uploaded to ServiceNow.

The administrator selects the appropriate import option and provides the spreadsheet file. ServiceNow reads the rows and columns and creates corresponding records in the Import Set table.

The imported data can then be reviewed before transformation.

## 3.5 Import Set Table

The Import Set table contains the data loaded from the spreadsheet.

For Example:

| Source Field | Imported Value |
|---|---|
| Employee ID | E001 |
| Name | Arun |
| Department | CSE |
| Email ID | arun1@gmail.com |

The Import Set table is not necessarily the final location of the data. It acts as an intermediate area for processing.

## 3.6 Creating a Transform Map

A Transform Map defines how data from the Import Set should be transferred to the target table.
While creating a Transform Map, the administrator selects:

- Source table
- Target table
- Field mappings
- Matching criteria where required
- Transformation logic where required

The Transform Map controls the movement of data from the source to the target.

# 4. DATA TRANSFORMATION AND FIELD MAPPING

## 4.1 Source and Target Tables

A Transform Map works with two important tables:

**Source Table** -The source table contains the imported spreadsheet data.

**Target Table -**The target table is the ServiceNow table where the final records are stored.

The basic relationship is:

**Source Table → Transform Map → Target Table**

## 4.2 Field Mapping

Field mapping connects a source field with a target field.

For example:

| Spreadsheet Field | Target Field |
|---|---|
| Employee ID | Employee ID |
| Name | Name |
| Department | Department |
| Email | Email |

The mapping tells ServiceNow where each source value should be placed.

## 4.3 Auto Mapping

ServiceNow can provide automatic field mapping when source and target field names are similar.

Auto mapping can reduce manual configuration. However, the administrator should verify the mappings before running the transformation.

## 4.4 Coalesce Field

Coalesce can be used to determine whether an imported record matches an existing target record.
For example, if Employee ID is used as a unique identifier, ServiceNow can use it to determine whether a record already exists.

This helps in situations where existing records need to be updated instead of creating duplicate records.

## 4.5 Transform Scripts

Transform Scripts can be used when simple field mapping is not sufficient.
Scripts can be used to:

- Modify values.
- Apply conditions.
- Perform calculations.
- Validate information.
- Apply additional transformation logic.

Transform scripts provide additional flexibility during data transformation.

## 4.6 Data Validation

After transformation, the target records should be checked carefully.
Validation includes:

- Checking required fields.
- Checking field values.
- Checking duplicate records.
- Checking data types.
- Comparing imported values with the spreadsheet.
- Checking transformation results.

# 5. IMPLEMENTATION / PRACTICAL WORK

## 5.1Preparing Excel Spreadsheet

The first step is to prepare the spreadsheet.
Example:

| Student ID | Student Name | Department | Email |
|---|---|---|---|
| S001 | Kavin | CSE | kavin@example.com |
| S002 | Divya | IT | divya@example.com |
| S003 | Hari | ECE | hari@example.com |

The column headings should clearly represent the data.

## 5.2 Loading Spreadsheet into ServiceNow

The prepared spreadsheet is uploaded into the ServiceNow instance.

ServiceNow reads the spreadsheet and loads the records into an Import Set.

The administrator can review the imported information before performing the transformation.

## 5.3 Creating Target Table

A target table is selected or created to store the final records.

The target table should contain fields corresponding to the information being imported.

For example:

- Student ID
- Student Name
- Department
- Email

## 5.4 Creating Transform Map

A Transform Map is created between the Import Set source table and the target table.

The Transform Map specifies how the source data should be processed and transferred.

## 5.5 Mapping Source Fields to Target Fields

The source fields are mapped to the corresponding target fields.
Example:

**Student ID → Student ID**
**Student Name → Student Name**
**Department → Department**
**Email → Email**

Correct mapping is important because incorrect mapping can place data into the wrong fields.

## 5.6 Running the Transform

After completing the mapping, the Transform Map is executed.

ServiceNow processes the records from the Import Set and transfers the data into the target table.

The transformation process may:

- Insert new records.
- Update existing records when configured for matching.
- Skip or reject records when errors occur.

## 5.7 Verifying Imported Records

After the transformation is completed, the target table is opened and the records are checked.

The administrator verifies:

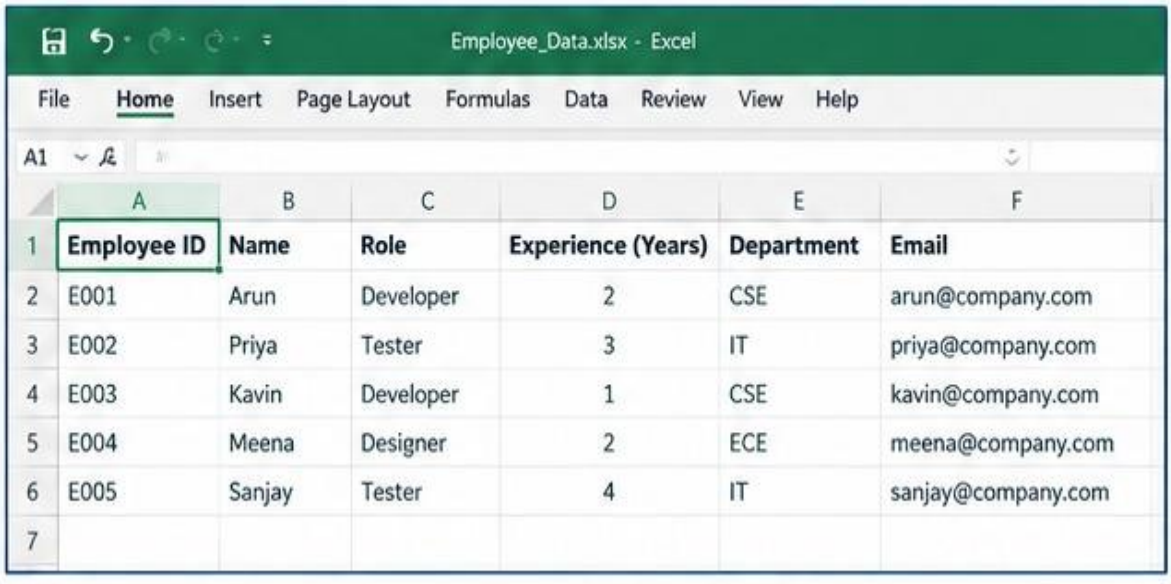

- Record count.
- Field values.
- Required fields.
- Duplicate records.
- Transformation status.

The final data should match the expected result from the spreadsheet.

# Excel Spreadsheet – Input Data

- The Excel spreadsheet contains the data that needs to be imported into ServiceNow.
- It includes fields such as Employee ID, Name, Role, Experience, Department, and Email.
- Each row represents one employee record.
- The column names are used to identify the required information.
- The data is checked before uploading to avoid incorrect values.
- This spreadsheet acts as the source data for the project.

## 1. Excel Spreadsheet (Input Data)

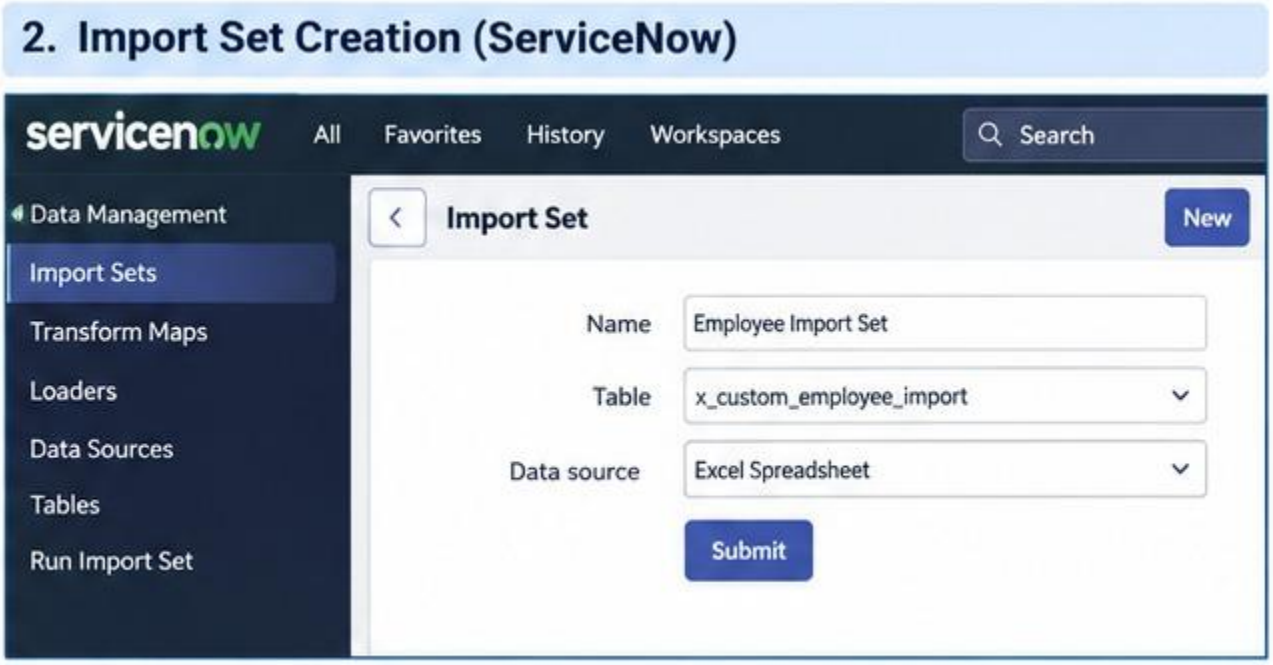

| | A | B | C | D | E | F |
|---|---|---|---|---|---|---|
| 1 | **Employee ID** | **Name** | **Role** | **Experience (Years)** | **Department** | **Email** |
| 2 | E001 | Arun | Developer | 2 | CSE | arun@company.com |
| 3 | E002 | Priya | Tester | 3 | IT | priya@company.com |
| 4 | E003 | Kavin | Developer | 1 | CSE | kavin@company.com |
| 5 | E004 | Meena | Designer | 2 | ECE | meena@company.com |
| 6 | E005 | Sanjay | Tester | 4 | IT | sanjay@company.com |
| 7 | | | | | | |

Excel file contains the source data with all the required fields.

# Import Set Creation

- **The prepared Excel spreadsheet is uploaded into ServiceNow using the Import Set process.**
- **The Import Set is used to temporarily store the imported spreadsheet data.**
- **ServiceNow reads the rows and columns from the uploaded file.**
- **The imported data is stored in an Import Set table.**
- **This provides an intermediate stage before the data reaches the target table.**
- **The administrator can review the imported data before transformation.**

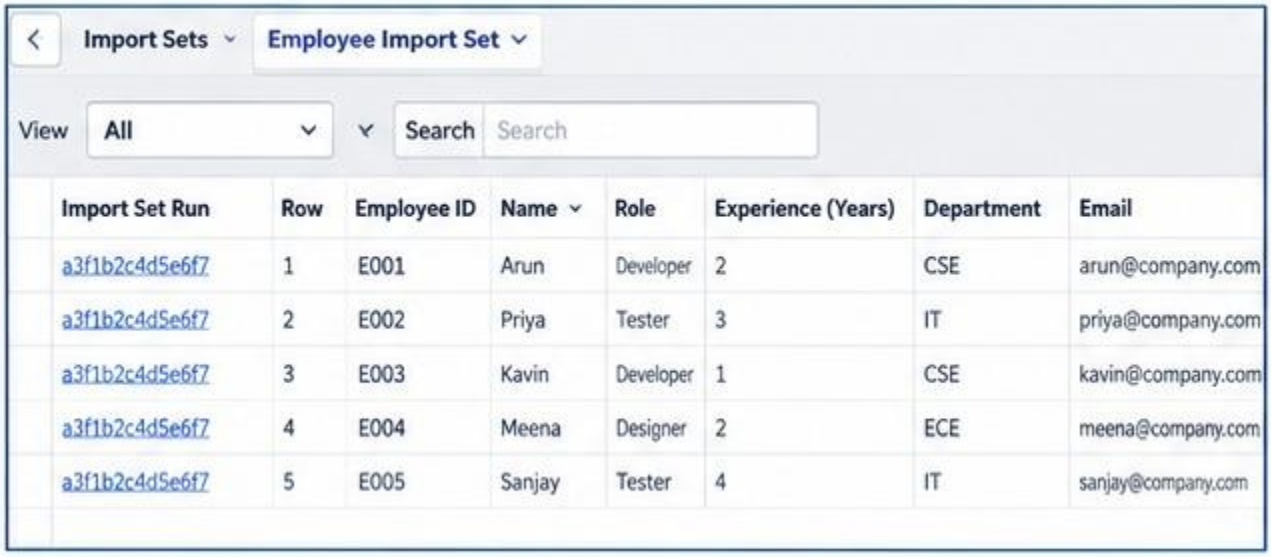

Create a new Import Set and specify the table and data source.

# Imported Data – Import Set Table

- After the spreadsheet is uploaded, the records are displayed in the Import Set table.
- The table contains the data received from the Excel spreadsheet.
- Each spreadsheet row is represented as an imported record.
- The fields can be checked to ensure that the data is loaded correctly.
- Any missing or incorrect values can be identified at this stage.
- The validated data is then ready for transformation.

## 3. Imported Data (Import Set Table)

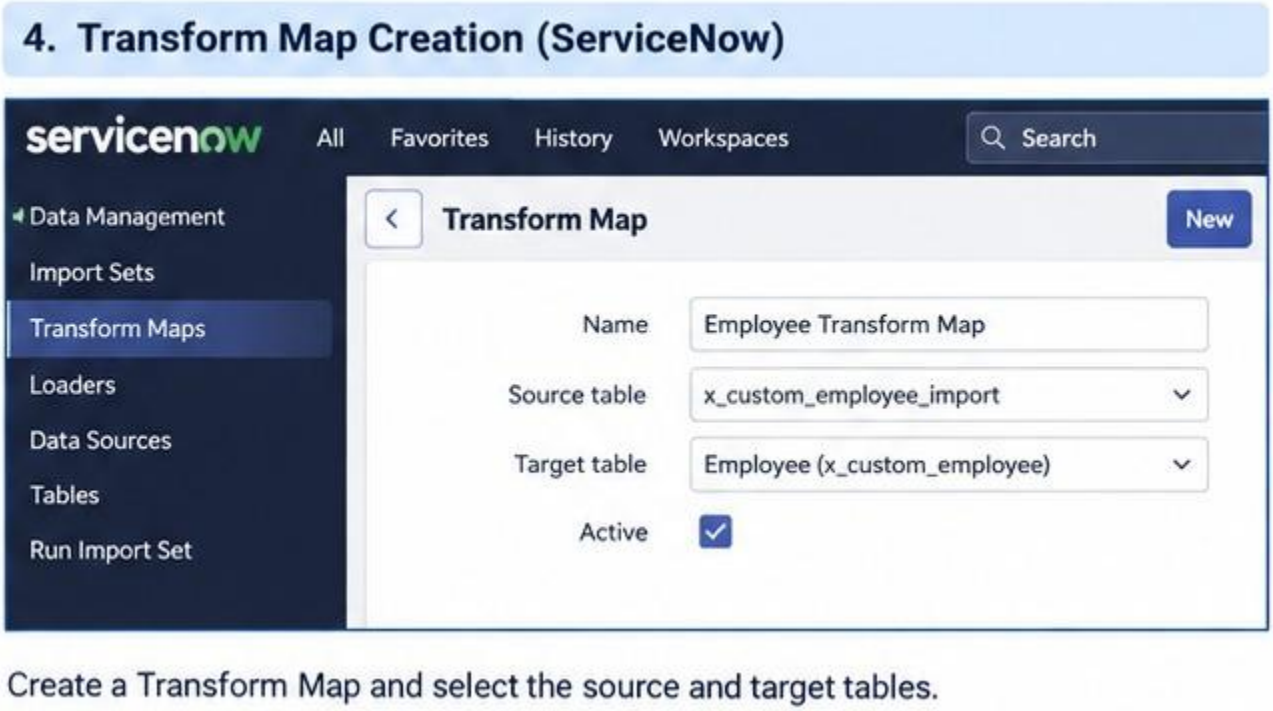

| Import Set Run | Row | Employee ID | Name | Role | Experience (Years) | Department | Email |
|---|---|---|---|---|---|---|---|
| a3f1b2c4d5e6f7 | 1 | E001 | Arun | Developer | 2 | CSE | arun@company.com |
| a3f1b2c4d5e6f7 | 2 | E002 | Priya | Tester | 3 | IT | priya@company.com |
| a3f1b2c4d5e6f7 | 3 | E003 | Kavin | Developer | 1 | CSE | kavin@company.com |
| a3f1b2c4d5e6f7 | 4 | E004 | Meena | Designer | 2 | ECE | meena@company.com |
| a3f1b2c4d5e6f7 | 5 | E005 | Sanjay | Tester | 4 | IT | sanjay@company.com |

The spreadsheet data gets loaded into the Import Set table.

# Transform Map Creation

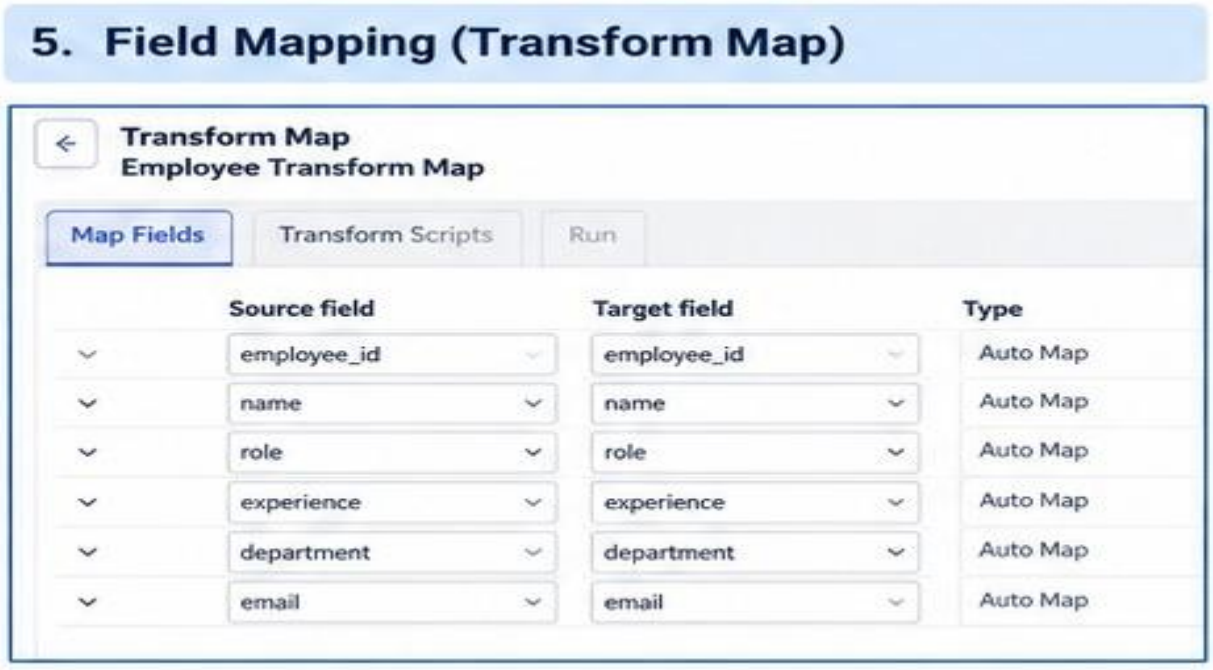

- A Transform Map is created to transfer data from the Import Set to the target table.
- It defines the relationship between the source table and the target table.
- The administrator selects the required source and target tables.
- The Transform Map controls how the imported data will be processed.
- It acts as a connection between the imported data and the final records.
- After creation, the required field mappings are configured.

Create a Transform Map and select the source and target tables.

# Field Mapping

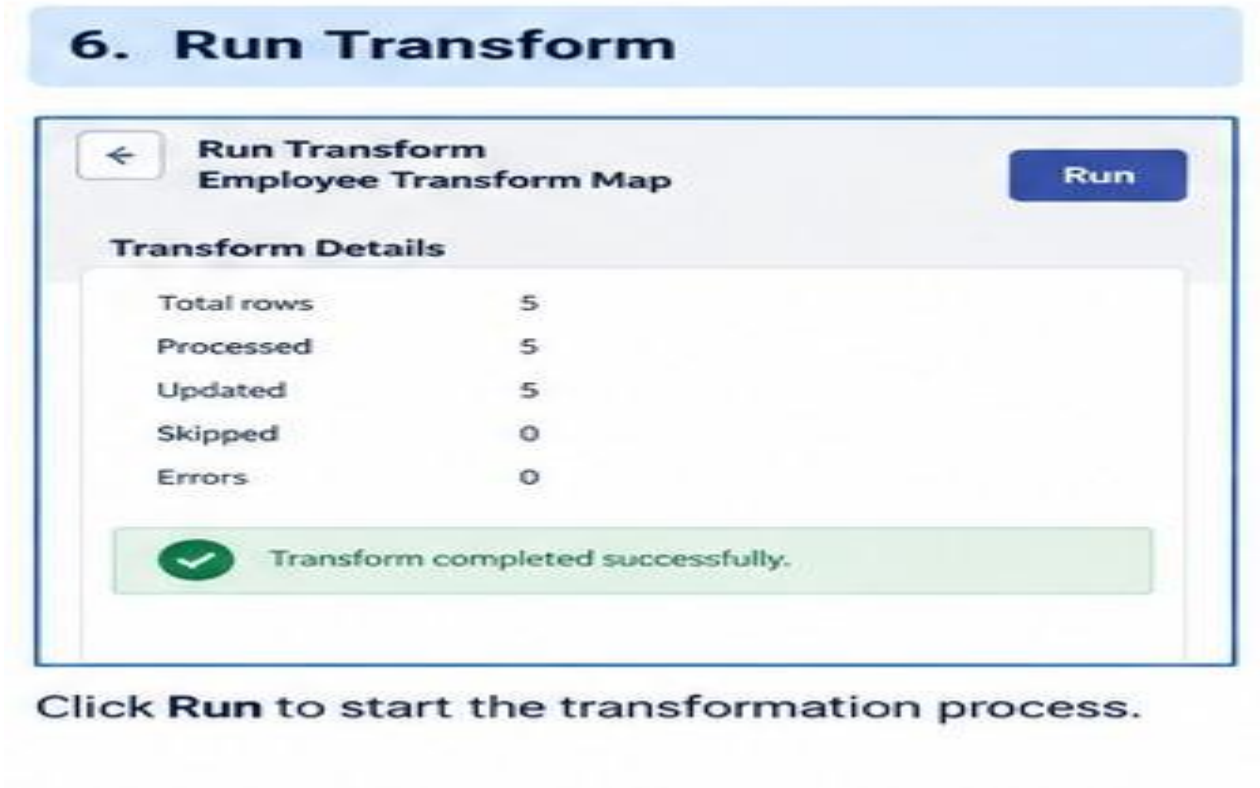

- Field mapping connects the fields in the Import Set with the corresponding target fields.
- For example, Name is mapped to Name and Role is mapped to Role.
- Similarly, Experience, Department, and Email are mapped to their target fields.
- Correct mapping ensures that data is stored in the appropriate fields.
- Automatic mapping can also be used when field names match.
- The mappings are reviewed before running the transformation.

Map the source fields from the Excel sheet to the target fields in ServiceNow.

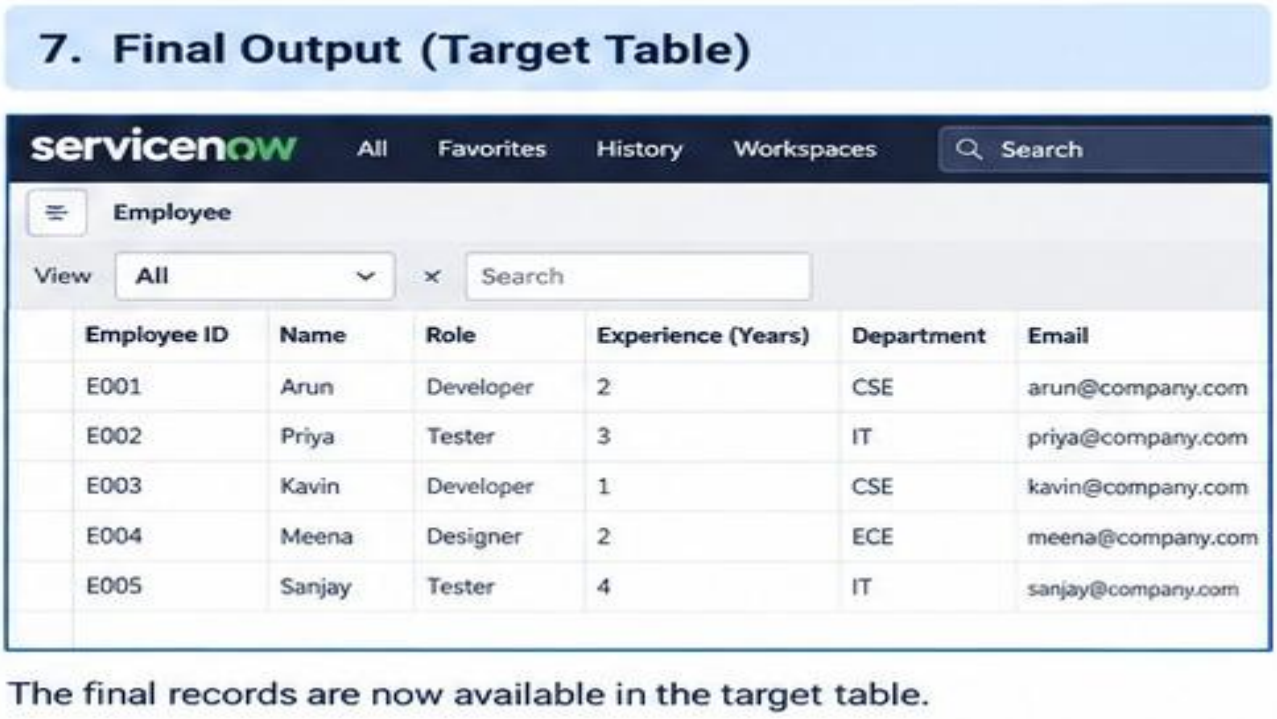

# Run Transform

- After completing the field mapping, the Transform Map is executed.
- The transformation process reads the records from the Import Set table.
- ServiceNow processes each record according to the configured mappings.
- The transformed data is then transferred to the target table.
- The transformation result can be checked for successful and failed records.
- This step completes the main data transfer process.

# Final Output – Target Table

- After the transformation is completed, the final records are available in the target table.
- The imported employee information can now be viewed in ServiceNow.
- The records are checked against the original Excel spreadsheet.
- Employee ID, Name, Role, Experience, and other fields are verified.
- This confirms that the data has been transferred correctly.
- The target table represents the final output of the project.

# 6. TESTING

## 6.1 Test Plan

Testing is performed to ensure that spreadsheet data is imported and transformed correctly.
The following areas are tested:

- File upload.
- Data loading.
- Field mapping.
- Transformation.
- Duplicate handling.
- Data validation.
- Final record creation.

## 6.2 Data Import Testing

A sample spreadsheet is imported into ServiceNow.
The administrator checks whether all valid rows are successfully loaded into the Import Set.

## 6.3 Field Mapping Testing

Each source field is checked against its corresponding target field.
For example:

**Name → Name**
**Department → Department**
**Email → Email**

This ensures that values are stored in the correct fields.

## 6.4 Duplicate Record Testing

Duplicate data is tested using an appropriate unique field.

If a matching record already exists, the configured transformation behavior should be verified.

This helps prevent unnecessary duplicate records.

## 6.5 Data Validation Testing

The final records are compared with the original spreadsheet.

The following are checked:

- Names
- IDs
- Departments
- Email addresses
- Other required fields

## 6.6 Test Results

The test results are recorded to determine whether the import was successful.

| Test Case | Expected Result | Status |
|---|---|---|
| Upload spreadsheet | File should load successfully | Pass |
| Import data | Records should appear in Import Set | Pass |
| Field mapping | Values should go to correct fields | Pass |
| Transform data | Records should reach target table | Pass |
| Validate records | Data should match source | Pass |

# 7. TECHNICAL CHALLENGES

## 7.1 Invalid Spreadsheet Data

Incorrect or incomplete spreadsheet values may cause problems during import.
**Solution -**The spreadsheet should be checked and cleaned before uploading.

## 7.2 Field Mapping Errors

Incorrect mapping can place data into the wrong target fields.
**Solution -**Each source-to-target field mapping should be reviewed before running the transformation.

## 7.3 Duplicate Records

Duplicate records may occur when the same information is imported multiple times.
**Solution -**A suitable unique field can be configured for matching existing records.

## 7.4 Data Type Issues

Different formats between the spreadsheet and ServiceNow may cause transformation issues.
For example, date, number, and text values may require proper formatting.
**Solution-** The spreadsheet data should be formatted consistently before importing.

## 7.5 Transformation Errors

Transformation may fail because of incorrect mappings, invalid values, or transformation logic.
**Solution** -The transformation results and error information should be reviewed, and the Transform Map should be corrected before running it again.

## 7.6 Advantages of the Proposed System

- Reduces manual data entry.
- Imports large amounts of data quickly.
- Provides proper field mapping.
- Reduces data entry errors.
- Helps maintain organized records.
- Makes data management easier.

## 7.7 Limitations of the System

- Incorrect spreadsheet data can cause import errors.
- Field names must be mapped correctly.
- Duplicate records may occur without proper configuration.
- Large files may require more processing time.
- Users need basic knowledge of ServiceNow.

## 7.8 Data Security and Access Control

Explain how ServiceNow controls access to imported data using users, roles, and permissions.

## 7.9 Error Handling and Troubleshooting

Explain common errors during import, such as incorrect field mapping, missing values, duplicate records, and invalid data, and how they can be identified and corrected.

## 7.10 Performance and Efficiency

Explain how Transform Maps help process multiple spreadsheet records efficiently instead of entering each record manually.

## 7.11 Real-World Applications

Explain where this process can be used, such as:

- Employee data import
- Customer data migration
- Asset records
- Incident records
- Department information
- Student records

## 7.12 Future Scope

You already have Future Enhancements, but you can add specific points such as:

- Automated scheduled imports
- Integration with external systems
- Advanced data validation
- Automated duplicate detection
- More transformation rules

## Recommended final order

5. Technical Challenges
6. Implementation / Design Challenges
7. Advantages
8. Limitations
9. Error Handling and Troubleshooting
10. Performance and Efficiency
11. Real-World Applications
12. Future Enhancements
13. Conclusion
14. References
15. Certificates / Screenshots

# 8. FUTURE ENHANCEMENTS

The project can be improved with additional features.

## 8.1 Automated Data Import

Data import can be automated to reduce manual involvement.

## 8.2 Scheduled Imports

Regular imports can be scheduled when data needs to be updated periodically.

## 8.3 Advanced Transform Scripts

More advanced transformation logic can be added to process complex data.

## 8.4 Data Validation Improvements

Additional validation rules can be introduced to identify incorrect or incomplete data before it reaches the target table.

## 8.5 Integration with External Systems

The same transformation concepts can be extended to data received from other systems and external data sources.

## Data Migration in ServiceNow

Explain the concept of moving data from Excel/external sources into ServiceNow.

## Source Data and Target Data

Explain clearly:

- What is source data?
- What is target data?
- How Excel acts as the source
- How the ServiceNow table acts as the target

## Import Set Table

Explain:

- Purpose of an Import Set Table
- How imported spreadsheet records are stored
- Why it is used before transformation

## Field Mapping Details

**You can make a full table:**

| Source Field | Target Field | Mapping Type |
|---|---|---|
| **Employee ID** | **Employee ID** | **Direct** |
| **Name** | **Name** | **Direct** |
| **Department** | **Department** | **Direct** |
| **Role** | **Role** | **Direct** |
| **Experience** | **Experience** | **Direct** |

## Data Transformation

**Explain what happens to the data between the Import Set Table and the Target Table.**

## Coalesce

**A separate section explaining how ServiceNow can identify an existing record and update it instead of creating another record.**

## Data Validation

**Explain checking:**

- **Missing values**
- **Incorrect formats**
- **Duplicate records**
- **Invalid field values**

## Transform Map Configuration

Explain the important configuration fields such as:

- Source table
- Target table
- Field maps
- Coalesce
- Transform scripts, if used

## Transform Map Field Map Types

Explain different mapping approaches such as direct mapping, mapping with transformation, and default values.

## Import and Transformation Logs

If available in your ServiceNow instance, add a screenshot of the import/transform result and explain what the status means.

## Project Results

**You can write what your project achieved, for example:**
The spreadsheet data was successfully imported into ServiceNow and mapped to the required target fields. The transformation process helped convert the source data into structured ServiceNow records.

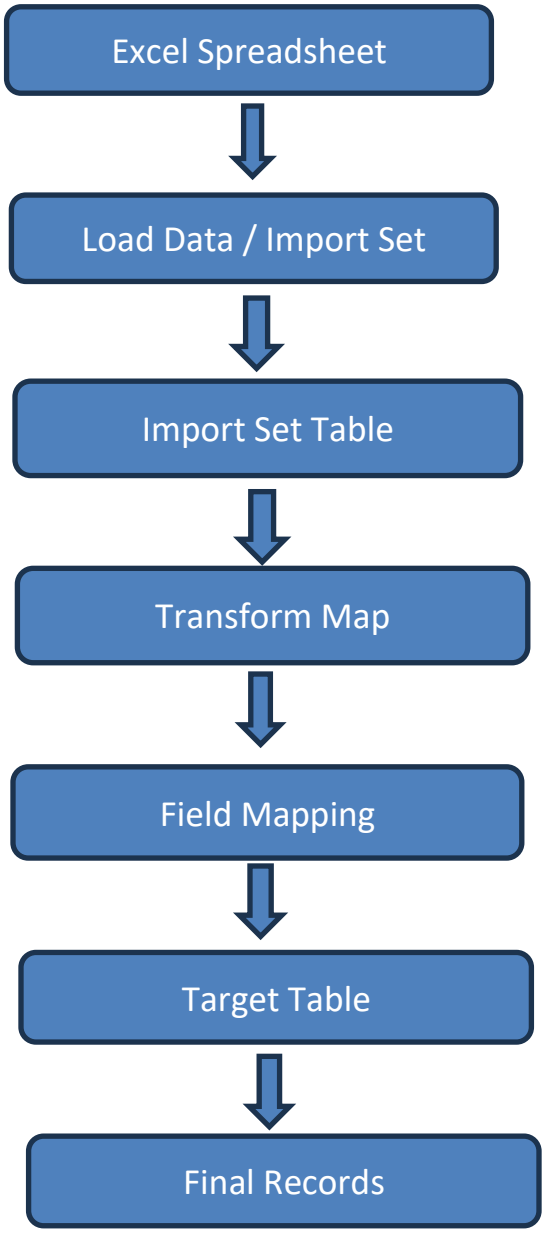

## Screenshots with Explanations

This is probably the easiest way to increase pages naturally. Add:

- Excel input screenshot
- Load Data screenshot
- Import Set Table screenshot
- Transform Map screenshot
- Field Mapping screenshot
- Transform result screenshot
- Target Table screenshot

## Overall Data Import Workflow Diagram

# 9. CONCLUSION

The project “Import Data Using Transform Maps (Spreadsheet) in ServiceNow” provides practical knowledge about importing external spreadsheet data into ServiceNow.

The project demonstrates the complete process starting from preparing spreadsheet data, creating an Import Set, importing the data, creating a Transform Map, mapping source fields to target fields, transforming the data, and validating the final records.

Through this project, the concepts of Import Sets, Transform Maps, Source Tables, Target Tables, Field Mapping, Coalesce, Data Transformation, and Validation are understood.

The use of Transform Maps reduces manual data entry and provides an organized method for transferring data into ServiceNow. This project also provides practical experience that is useful for understanding ServiceNow administration and data management.
